Comparative pharmacological effects of transdermal versus oral transmucosal fentanyl citrate in rat acute pain models. Transdermal fentanyl citrate is a recently approved transmucosal fentanyl product for the management of breakthrough pain (BTP). In order to evaluate its pharmacological effects in comparison to that of oral transmucosal fentanyl citrate, the current study was designed to assess the analgesic efficacy and side effects of transdermal fentanyl citrate in comparison to oral transmucosal fentanyl citrate. In a rat model of unilateral paw incision, the efficacy and side effects of transdermal fentanyl citrate and oral transmucosal fentanyl citrate were compared. A significant increase in weight bearing ($P < 0.05$). In the rat model of paw pressure, there was no difference between the effects of oral transmucosal fentanyl citrate and transdermal fentanyl citrate ($P > 0.05$). We conclude that transdermal fentanyl citrate has similar analgesic effects as oral transmucosal fentanyl citrate, but without the side effects of edema, and may be a suitable treatment option for BTP.
